TO DO

Problem Description:

For some special projects like qtbase-5.11, it will cost lots of time in the process of generating Tmp files. Most of the time consumption is on compiling and nodes extraction by hook, because some h/c/c++ files are so large that each of them has 200 thousand lines of code which will generate 400 thousand nodes, the amount of which equals to the 2-3 small projects' nodes.

Possible Solution:

1. Some of the files are test files or example files to verify the feasibility of these projects, so you can ignore these test files to save time.

2. If the large files are important file in the project, you can replace clang with other compilers like antlr, of which the compiling speed is much faster.
